Equation of the line is,

$$\mathbf{n}^T \mathbf{x} = 0 \quad (2.0.7)$$

$$(-\sin \theta - m \cos \theta \quad \cos \theta - m \sin \theta) \mathbf{x} = 0 \quad (2.0.8)$$

To plot the line,

Assuming  $m = 1$ ,  $c = 6$  and  $\theta = \pi/2$

ie,

$$\mathbf{n} = \begin{pmatrix} -\sin \pi/2 - \cos \pi/2 \\ \cos \pi/2 - \sin \pi/2 \end{pmatrix} \quad (2.0.9)$$

$$\mathbf{n} = \begin{pmatrix} -1 \\ -1 \end{pmatrix} \quad (2.0.10)$$

Therefore, Equation of the line is  $(-1 \quad -1)x = 0$

## 1 QUESTION No. 2.110

Find the equation of the line passing through the origin and making an angle  $\theta$  with the line  $(-m \ 1)x = c$

## 2 SOLUTION

Given, Equation of the line,

$$L_1 = \mathbf{n}_1^T \mathbf{x} = c \quad (2.0.1)$$

$$\mathbf{n}_1 = \begin{pmatrix} -m \\ 1 \end{pmatrix} \quad (2.0.2)$$

Line 'L' makes angle  $\theta$  with  $L_1$

We get the normal vector ,n of L when we multiply the rotation matrix with normal vector of  $L_1$

$$\mathbf{n} = \begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix} \begin{pmatrix} -m \\ 1 \end{pmatrix} \quad (2.0.3)$$

$$\mathbf{n} = \begin{pmatrix} -m \cos \theta - \sin \theta \\ -m \sin \theta + \cos \theta \end{pmatrix} \quad (2.0.4)$$

Equation of a line is,

$$\mathbf{n}^T (\mathbf{x} - \mathbf{A}) = 0 \quad (2.0.5)$$

Since L passes through the origin,

$$\mathbf{A} = \begin{pmatrix} 0 \\ 0 \end{pmatrix} \quad (2.0.6)$$
